

Many barriers exist that prevent the successful development and adoption of well-performing, context specific AI tools in low-resource healthcare settings

Artificial intelligence for strengthening healthcare systems in low- and middle-income countries: a systematic scoping review

Introduction

- **Artificial Intelligence (AI)** applications in medicine have **rapidly developed** in recent years
- AI has potential to **strengthen health systems** by improving **capacity** and **capabilities** in low-resource settings
- There is **limited research** exploring the implementation of **AI in healthcare in LMICs**

Methods

- Followed the **PRISMA-ScR guidance** (Preferred Reporting Items for Systematic Reviews and Meta-Analyses Extension for Scoping Reviews)
- **Databases searched** included Scopus, EMBASE, MEDLINE, Global Health and APA PsycInfo Databases, and Google Scholar for grey literature
- Variety of **search terms** consisting of **concepts related to AI, healthcare, and LMICs** to identify a broad range of peer-reviewed, original records
- **Screening** performed using the Covidence Systematic Review Software according to the criteria in Table 1

Results

- From **1126 articles** found in our search, **10 articles** were included in our analysis
- **Geographically**, 4 studies were conducted in China, while 6 represented LMICs across Latin America, South Asia and Sub-Saharan Africa - mostly representing upper-middle income countries
- The **clinical applications** of the AI tools included diagnosis, screening, patient triage, and care planning and provision
- Regarding **AI tool training**, only 50% of studies described the **algorithms** and 50% described **training data** used
- 70% of studies used **black box** AI tools **without interpretable outputs**
- **Discordance** between clinicians and AI tools was attributed to using **training data from outside their applied contexts**
- **Higher workloads** were reported in clinical settings with low capacity for adopting new AI tools, while **shortened time to diagnosis/care** was seen in some settings
- **Poor user friendliness** was a barrier to effective implementation
- **Distrust** of AI tools was expressed by some clinicians and patients in Chinese contexts
- **Little evidence** exists to link AI tools with **cost-effective improvements in health outcomes**
- **Poor accounting for local contexts** was a common theme in our included studies

PICOS	Inclusion	Exclusion
Population	• Health care workers and/or patients, given AI implemented in a country defined as a low- and middle-income country	• Non-health-related sample • Health care workers, given AI implementation in high-income or unspecified country
Intervention	• AI Implemented in a global health context	• AI not implemented, only theoretically described • Focus on model testing, no real-world application
Comparison	• Comparison of AI intervention to standard methods • Qualitative evaluation of sample population to AI intervention	• No form of comparison conducted
Outcome	• Evaluation of AI in a global health context	• AI used as a secondary tool to analyse another outcome
Study Design	• Any primary research, qualitative or quantitative • Full text available • Peer-reviewed	• Secondary/synthesis research • Only abstract available • Commentaries • Letters, letters to editor • Policy briefs • Study protocols
Language	• English	• Non-English full-text
Timeframe	• Published after 1st Jan 2009	• Published until 31st Dec 2008
